

# Product Requirement Document (PRD)

## Simplified

**Project Title: Crowdsourced Interactive FAQ Platform**  
**([samagama.in/internship/faq](https://samagama.in/internship/faq))**

### 1. User Interface Strategy

The goal of this redesign is to move away from heavy walls of text that frustrate students during critical moments (like test crashes or delayed offer letters). The new design features a single-page layout where the core header remains stationary, while the main viewing window dynamically adjusts content based on the user's active choices.

#### **Legacy Features to STRICTLY AVOID / EXCLUDE in the New Project:**

- **NO Numerical Statistics Panels:** Do not build or include any numeric counter blocks, metrics, or statistical trackers on the dashboard.
- **NO Static Walls of Text:** Do not present a long list of all FAQs simultaneously.
- **NO Recent Activity Feeds:** Completely exclude any historical log or stream showing "recent user activity".
- **NO Qualification Quizzes:** The platform must not include any diagnostic filters designed to check if a user is qualified to join the internship.

#### **Core Replacement Elements to INCLUDE:**

- **Static Header:** Left-aligned [[Logo](#)] [FAQ Central Hub](#) and right-aligned [[Admin Portal Link](#)].
- **Clean Welcome Message:** Render a simple, reassuring text passage to set a professional tone.
- **Global Floating Chatbot Gateway:** Position a permanent, sticky floating assistant icon in the corner of every screen view. Clicking this must instantly redirect the user to the dedicated interactive AI chatbot workspace.

## 2. Dynamic Workspace States (The 3 Core Functional Panels)

The active window area below the main greeting switches dynamically between three distinct interaction panels based on user selection:

State 1: Browse & Search FAQs (Option 1)

- **Optimized Keyword Search:** A clean search box backed by an automatic prediction/suggestion dropdown system.
- **Category Filter Navigation:** Clickable horizontal buttons to quickly isolate primary internship lifecycle stages: (we will modify this based on the categories of questions)
  - *Application & Profile Setup*
  - *Test & Coding Assessment*
  - *Stipend & Offer Letters*
- **Collapsible Accordion Streams:** Matching results display instantly beneath the filters as clean, click-to-expand question headers.
- **Media-Enriched Solutions:** Expandable answers for multi-step technical guidelines must natively support short walkthrough GIFs, interface screenshots, or 1-minute video clips (e.g., visualizing where to upload a resume or reset a password). (we can create these clips using Notebook LLM)

State 2: Submit a New FAQ / Support Ticket (Option 2)

- **Standard Input Form:** Captures student email address, a structured category selector dropdown, and a detailed description textbox.
- **Tracking Receipt:** Generates and displays a unique, copyable Ticket Tracking ID immediately upon submission.

State 3: Ticket Tracking Workspace (Option 3)

- **Status Viewer:** A dedicated interface where a student inputs their unique tracking receipt token to retrieve live operational progress updates from the database.

## 3. Operational Mechanics & Crowd Integration

Two-Tiered Question Categorization:

The database schema must separate data visibility into two distinct buckets to preserve official information integrity:

1. User-Asked Questions: Community-submitted inquiries undergoing peer review and active engagement.
2. Frequently Asked Questions (Official FAQs): Corporate-verified, certified operational documentation.

### Safe Pipeline Voting & Promotion Engine

To prevent platform spam and ensure strict informational accuracy, the promotion lifecycle must adhere to a verified pipeline gateway:

- \* Submission State: When a student submits a question via the Option 2 workspace, it is placed in a 'pending' state.
- \* Step 1 (Admin Quality Gate): The Site Administrator reviews the question for clarity, safety, and duplicate issues. Upon approval, its status updates to 'public\_community', rendering it visible in the user-asked stream.
- \* Step 2 (Community Engagement): Students can cast upvotes for community questions, write comment responses, and rate answer helpfulness using a standard 1-to-5 star metric.
- \* Step 3 (Auto-Promotion Threshold): As soon as a validated 'public\_community' entry crosses a predefined threshold number of upvotes (e.g., 15 upvotes), the backend pipeline triggers a database update setting `isOfficialFAQ = true`, automatically moving it into the "Official FAQ" section without requiring a second manual admin action.

### Dynamic Layout Components

- \* Daily Trending Module: A prominent widget displaying the absolute most frequently searched or upvoted community question tracked during that specific 24-hour cycle.
- \* Automated Content Tagging: The backend must map labels to pre-existing answers using an AI-assisted tag suggestion engine during the admin validation phase.
- \* Documentation Support Center: A distinct static reference view acting as a structural user guide detailing platform rules, community behavior codes, and submission guidelines.

#### 4. Technical Constraints & Architecture Alignment (MERN)

- **Frontend System:** React.js configured with TanStack Router for view state management and TanStack Query for cache synchronization.
- **Backend Application Layer:** Node.js environment utilizing Express.js server frameworks.
- **Database Tier:** MongoDB managed programmatically via Mongoose Object Data Modeling (ODM) schemas.
- **Admin Separation:** Establish a highly secure, entirely isolated administrative control portal featuring bookmarking capabilities and system notification triggers.

#### 5. Unique Strategic Innovations (Added to Original Ideas)

##### Innovation A: The 3-Step Emergency Diagnostic Quiz

Instead of filtering through generic text blocks, a frustrated user can run a highly targeted, 3-question emergency wizard on the home dashboard to bypass general browsing.

- **Question 1 (Core Focus Area):** *What area are you facing a problem with? \* ☐*  
The Selection Process (AI Interview, Test Link, or Assessment issues)
  - ☐ Onboarding & Documents (Offer Letter, Welcome Letter verification)
  - ☐ The Internship Tasks (Code roadblocks, GitHub issues, project submission)
- **Question 2 (Current Phase):** *Which specific phase are you currently in?*
  - ☐ Applied: Just submitted my application, waiting for the test.
  - ☐ In Progress: Currently doing the test or active in the internship.
  - ☐ Completed: Finished everything, waiting for final certificate/stipend.
- **Question 3 (Urgency Timeline):** *How long have you been facing this issue?*
  - ☐ Just happened right now (Urgent technical error)
  - ☐ 1 to 3 working days
  - ☐ More than 4 working days

**System Behavior:** The UI dynamically hides all generic site categories and outputs a single, high-priority emergency action script block.

##### Innovation B: Debounced Duplicate Submission Blocker

- **Goal:** Solve the duplicate FAQ clutter problem before data touches the server.
- **Mechanism:** As a student types into the title field of the Ticket Submission window (State 2), the frontend triggers a debounced string-matching keyword lookup against the database. If a parallel question match is caught, an instant UI

panel alerts: *"Is this your issue?"* and offers the solution immediately, preventing unnecessary ticket accumulation.

**Innovation C: Content Gap Metrics Matrix (Future-Facing Analytics)**

- **Goal:** Empower administrators with an automated data-improvement roadmap.
- **Mechanism:** The application logs whenever a search input yields zero results or when published community answers receive a high ratio of unhelpful ratings. These specific terms are grouped inside the isolated Admin Portal as a priority checklist, calling out content gaps that require attention.

Copy and paste these structural layouts directly into the code-generation prompt so the LLM knows exactly how to arrange the React components, Tailwind CSS styling, and conditional rendering states.

**Layout 1: Main Dashboard (Default State)**

*This layout handles the welcome greeting and the primary navigation cards. The static header and the floating chatbot button remain fixed on the screen at all times.*

## Layout 2: Active Workspace - State 1 (Browse & Search FAQs)

Triggered when a user clicks **Option 1**. It replaces the active workspace zone with an auto-suggest search bar, category chips, a trending widget, and split views for official FAQs vs. community questions.

### Layout 3: Active Workspace - State 2 (Submit a New FAQ/Ticket)

Triggered when a user clicks **Option 2**. It includes the debounced duplicate checking feature to intercept identical submissions before they create data clutter.
